

## Claymore Water Injection Projects | 2013

### Talisman Sinopec Energy UK Limited

**Dundas scope:** Petroleum Economics, Development Engineering

#### PROJECT DESCRIPTION

Production from the Talisman-Sinopec operated Claymore field has historically shown a strong response to water injection. An opportunity has been identified to dramatically improve production by making targeted improvements to water injection facilities on Claymore. The portfolio of projects were approaching the 'Appraise to Select' decision gate at the time of writing.

#### DUNDAS ROLE

Dundas provided support to the development engineering and economics teams in order to define and evaluate the relative profitability of a number of strategies identified. Dundas' scope of work included review and interpretation of technical deliverables, technical work required to develop key data inputs, and the preparation of a full package of input data templates for economic analysis in an automated tool.

A holistic view was taken of both of the technical and economic aspects of the Appraise phase works, ensuring their alignment in the development of a robust business case.
